ABSTRACT: Given the semibounded operator \mathcal{L} in Hilbert space, the following non-stationary problems are considered:

$$u_{tt} + \mathcal{L}u = f(x)e^{i\omega t};$$

$$u|_{t=0} = 0, \quad u_t|_{t=0} = 0;$$

$$u_{tt} + \mathcal{L}u = 0;$$

$$u|_{t=0} = 0, \quad u_t|_{t=0} = g(x).$$

Necessary and sufficient conditions are formulated such that the operator \mathcal{L} will satisfy the principle of limiting amplitude expressed in the form

ABSTRACT: Given Ω the exterior of a sphere with boundary Γ in space E_3 or the entire space E_3 . L is an operator defined by the differential expression $Lu = -\Delta u + c(x)u$. $H(x, y, -p^2)$ is the resolvent kernel of operator L for the region Ω . The author studies the analytic extension of the function $u(x, p) = \int H(x, y, -p^2)f(y)dy$, the results obtained are used to solve the problem $u_{tt} + Lu = f(x)e^{it}$ for $t \rightarrow \infty$. TITLE: On the domain free of resonance poles in the problem of scattering by a three-dimensional potential

SOURCE: AN SSSR. Doklady, v. 166, no. 6, 1966, 1319-1322

TOPIC TAGS: potential scattering, Schroedinger equations, wave function, wave function analytic continuation

ABSTRACT: In connection with scattering of particles by a three-dimensional potential, the Schrödinger equation

$$\Delta u + k^2 u - V(x)u = 0, \quad x = (x_1, x_2, x_3), \quad (1)$$

is analyzed under the assumption that the potential $V(x)$ is a differentiable, finite function. It is proven that the solution $u(x, k)$ of equation (1) has an analytic continuation in the entire plane of the complex variable $k = \sigma + i\tau$. This continuation is regular in the half-plane $\text{Im } k > 0$. It is established that the poles of the function

Card 1/2

UDC: 517.9:539.1

L 20814-66

ACC NR: AP6009418

$u(x, k)$ (the wave function) are located in the plane $\text{Im } k < 0$ and for large σ values they are under the curve

$$\tau = -a \ln|\sigma| + b, \quad (2)$$

where $a > 0$ and b are certain constants. It is noted that since the poles of the scattering amplitude coincide with the poles of the wave function $u(x, k)$ the derived results can be extended to the scattering amplitude. The problem of the analytic continuation of the wave function is also considered in the case when instead of the finiteness of the potential, the condition

$$\int e^{-ax} |V(x)| dx < C(a), \quad C(a) = \text{const}, \quad (3)$$

where $a > 0$ is an arbitrary number, is satisfied. Orig. art. has: [LK].

TOPIC TAGS: antenna directivity, aircraft antenna, antenna radiation pattern

ABSTRACT: The author considers the problem of determining the spatial distribution of radiating elements corresponding to a given directional pattern. It is shown that this distribution is uniquely determined by the directional pattern. A class of functions is defined which are directional patterns for the distribution of radiating elements concentrated in a bounded region of space. A procedure is given for finding the distribution of radiating elements from a directional pattern. If the vector properties of the field are taken into account, the distribution of the radiating elements will not generally speaking be uniquely determined by the directional pattern. TITLE: Effect of inertial forces on vibration-frequency sensors B

SOURCE: Izmeritel'naya tekhnika, no. 11, 1964, 35-37

TOPIC TAGS: measuring sensor, vibration frequency sensor, primary element

ABSTRACT: Some theoretical considerations are offered regarding the effect of inertial (e.g., centrifugal) forces on vibration of the sensitive element represented by a flat bar with one constrained end. Several positions of the bar with respect to the inertial-force field are analyzed: (1) Centrifugal and Coriolis forces are applied in the maximum-stiffness plane of the bar; (2) Centrifugal and Coriolis forces are at right angles, etc. Formulas for calculating frequency errors are developed. AUTHOR: Ramm, A. G.

TITLE: A study of the scattering problem in certain infinite domains. I.

PERIODICAL: Leningrad. Universitet. Vestnik, no. 7. Seriya matematiki, mekhaniki i astronomii, no. 2, 45-66

TEXT: In his study of the problem of the dispersion of plane waves on the surface of an infinite domain, the author examines the resolvent of the Laplace operator of the Dirichlet problem in the domain $0 \leq \varphi \leq \alpha$ on a plane. He finds that the resolvent kernel $G(x, y, k + i\epsilon)$ uniformly tends to its limit on the real axis. The kernel $G(x, y, k)$ allows the asymptotic $\underset{r=|y| \rightarrow \infty}{\widetilde{\sim}} \arg y = \omega$

$\sim \gamma(r)u(x, \omega, k)$. The functions $u(x, \omega, k)$ are solutions of the scattering problem of plane waves on the surface indicated. The author arrives at a theory of decomposition on the basis of functions $u(x, \omega, k)$. He transfers all these results to the domains whose boundaries coincide with the boundary of the triangle $0 \leq \varphi \leq \alpha$ outside a given circle. He obtains the estimates of the Green functions of the Helmholtz operator in the domain with unlimited boundary.

This book is intended for scientific and technical personnel in the field of metallurgy.

Comments. This is a collection of articles on certain aspects of Soviet metallurgy. The book is dedicated to Academician Nikolai Fedorovich Dzerzhinsky on the occasion of his 75th birthday. The first part consists of 100 articles dealing with the development of Soviet metallurgy and its present-day activity in the Soviet Union. It includes an article by Z. Chapiro, Michaelis Orman, and Leon Kildin, "Metallurgy in the Soviet Union and the United States." The second part consists of three articles dealing with raw materials and fuel for the Soviet metallurgical industry. The third part represents the major portion of the book. It consists of 205 articles dealing with problems of the metallurgy of pig iron and steel. Chapter four consists of two articles treating the metallurgy of various metals. The fifth part consists of three articles on the refining of metals. The sixth part consists of eight articles discussing the various aspects of physical metallurgy. The last part deals with general problems in the field of metallurgy. References are given after each article. No summaries are given.

TITLE: Theoretical Fundamentals of the Employment of Fluxed Sinter in Blast Furnaces (Teoreticheskiye osnovy primeneniya oflyusovannogo aglomerata v domennykh pechakh)

PERIODICAL: Tr. Nauch. tekhn. o-va chernoy metallurgii, 1956, Vol 8, pp 44-64; Stal', 1954, Nr 12, pp 1073-1081

ABSTRACT: The thermal equivalents of the charge components and comparisons of the heat balances of the blast-furnace process with utilization of fluxed sinter (FS) and raw limestone are employed by the author to derive equations for calculation of possible coke savings. Calculations based thereon for standard smelting conditions show that coke savings per kg of limestone eliminated from the blast-furnace charge come to 0.4-0.5 kg. Thus, when 0.25-0.4 t raw limestone is eliminated from the blast-furnace charge per t coke, the reduction in relative coke consumption and the increase in furnace-output capacity may attain 10-15%. The limits of coke economy depend upon the reducibility of the FS. The maximum coke saving theoretically

Card 1/2

SOV/137-57-10-18807

Theoretical Fundamentals of the Employment of Fluxed Sinter (cont.)

possible corresponds to the attainment of an equilibrium ratio, $i = \text{CO}_2:\text{CO}$, in blast-furnace gas and of minimum identical reducibility of fluxed and unfluxed sinter. From these conditions, equations are derived for calculation of the maximum coke economies possible when ordinary sinter and limestone are replaced by FS. The employment of FS reduces the thickness of the belt of viscous primary slags, and this leads to a diminution in overall loss of gas head in the blast furnace. Therefore, the increase in output capacity on conversion to FS may be greater than the reduction in coke consumption alone would indicate. The possible coke saving rises with increase in the proportion of raw limestone converted from blast-furnace usage to sinter mix. The optimum degree of sinter fluxing should be determined primarily by its physical properties and the output capacity of the sintering machines.

TITLE: On the Effect of Smelting Intensity on the Productivity of Blast Furnaces and on the Relative Coke Consumption (O vliyanii intensivnosti plavki na proizvoditel'nost' domennykh pechey i otnositel'nyy raskhod koksa)

PERIODICAL: V sb.: Issled. domennogo protessa. Moscow, AN SSSR,
1957, pp 85-97

ABSTRACT: The index of the smelting intensity in a blast furnace, J, is related to the blast-furnace utilization coefficient (Transl. Ed. Note: m^3 of furnace chamber volume per ton of blast per day), v_p , and to the relative coke consumption, K, by the equation: $J = k/v_p$ (t/m^3) or $p_v = J/k$ (where $p_v = 1/v_p$). The relative coke consumption is to a large degree a function of the intensity of smelting. A value of the intensity of smelting exists which is most favorable with regard to the coke consumption. Firstly, as this optimum regimen is approached, the productivity of the furnace may be increased with a reduction in coke consumption.

Card 1/2

137-1958-3-4735

On the Effect of Smelting Intensity on the Productivity (cont.)

Exceeding this optimum regimen results in an excessive consumption of coke and only a slight increase in the productivity of the furnace, followed by a decrease in productivity. The optimal degree of intensity of blast furnace smelting may be raised by means of improving the design of the furnace and by improving the quality of the raw material. The reduction in coke consumption accompanying an increased smelting intensity, is attributable to improved distribution of the gases throughout the furnace, and some increase in the rate of the reduction processes in the shaft of the blast furnace. A critical survey of literature on the subject is presented. Production results of the operation of blast furnace Nr 2 at the "Zaporozhstal'" are developed in detail; analysis of these results confirms the Author's general postulates concerning the relationship between the intensity of smelting, the specific coke consumption, and the productivity of the furnace. Considerations dealing with methods of determining the most economical smelting regimens for a given individual plant are also offered.

G. S. RAMM, Triode generators of superhigh frequency oscillations. Voenizdat, 1955, 248 pp.
Questions of using triodes to generate super-high frequency oscillations are explained.
A method is given of computing triode currents; graphs are given permitting the simple
enough technical computation of tube generators in various regions; question is considered
of joint tube and oscillator system operation.

TOPIC TAGS: electronic oscillator, oscillator theory, electron tube

ABSTRACT: A method is presented for calculating a self-excited oscillator with
nonsinusoidal voltages on tube electrodes (additional resonances are present).
The tube static characteristics are known, the tube load is linear (consists of
passive elements) and resonates at ω_0 , $2\omega_0$, $3\omega_0$. In this case, the stationary

anode voltage is: $U_a = U_{a0} - \sum_{k=1}^3 U_{mk} \cos(k\omega_0 t + \varphi_k)$, where U_{mk} are harmonic amplitudes,

φ_k are their initial phases, ω_0 is an unknown frequency so close to ω_1 that
their difference is neglected. Amplitudes and initial phases of harmonics are
found for transient conditions, which permits examining the transient process
in the oscillator. The possibility of realization of required parameters is
discussed. Seven figures. Bibliography of 5 titles. L. S. [Translation of abstract]

SOURCE: Leningrad. Elektrotekhnicheskiy institut svyazi. Nauchno-tehnicheskaya konferentsiya. Trudy, no. 1, 1964, 67-76

TOPIC TAGS: oscillator theory, oscillator circuit, circuit design

ABSTRACT: The purpose of the paper was to construct a self-excited oscillator theory which would permit the computation of the currents and voltages in the oscillator despite the presence of additional resonance. The method presented, which is a development and refinement of the so-called "quasi-linear method," permits the calculation of the oscillations in the oscillator circuit with nonsinusoidal voltages in the tube electrodes. The method also makes it possible to study the process of sustained auto-oscillations, permitting the design

CITED SOURCE: Tr. uchebn. in-tov svyazi. M-vo svyazi SSSR, vyp. 20, 1964, 15-23

TOPIC TAGS: klystron amplifier, high power klystron amplifier

TRANSLATION: The final resonator of a multiresonator klystron amplifier is considered with an assumption that this resonator and its load form a linear system whose frequency characteristic, under zero excitation condition, is known. The final-resonator gap voltage is determined as a function of the excitation frequency. The frequency characteristics of a klystron amplifier operating under nonlinear (high-amplitude) conditions are calculated by a quasilinear method for the case when the gap transit angle, under static conditions, is 90°. Design curves and tables are supplied for the case when the klystron incoming convection

Card 1/2

L 3030-6

current can be approximated by a step curve. The klystron amplifier is analogous to the ordinary electron-tube amplifier in that the allowance for the amplifier nonlinearity results in a narrower passband and in a closer position of the maxima of the Chebyshev-type frequency characteristic, this phenomena being more pronounced in the klystron amplifier. TEXT: In making computer calculations on large oscillators it is necessary to know the static characteristics of tubes, i.e. the relationship between the anode and grid currents and the anode and grid voltages. The accuracy must be high, for example, with an error of 0.1%, so that numerical solution of a problem with multiple reiteration always leads to the same results. By way of example, a semi-graphical method is applied to a triode type FY-10A (GU-10A). ✓ 3 literature references.

AUTHOR: Ramm, G. S.

TITLE: Calculation of transistorized amplifiers with feedback

PERIODICAL: Elektrosvyaz', no. 7, 1961, 30 - 36

TEXT: This article is a purely theoretical analysis of transistorized amplifiers with feedback in the general case, i.e. without any limiting assumptions as to the operation of the feedback circuit. Fig. 1 is a block-diagram of the amplifier (amplifier K_c). The K-circuit represents the amplifier (linear fourpole) all the parameters of which are supposed to be known. The β -circuit (linear circuit) ensures the feedback and the coupling of the K-circuit to the signal source E and to the load Z_1 . The aim of the analysis is to derive formulae (taking into account the feedback effect) for:

$$\text{the amplification factor } K_c = \frac{U_1}{E}, \quad (1)$$

$$\text{the input admittance } Y_{\text{inp}} c = \frac{1}{E}, \quad (2)$$

$$\text{and the output admittance } Y_{\text{outp}} c = \frac{(I_1)_{\text{sh.circ.}}}{(U_1)_{\text{open}}}, \quad (3)$$

Card 1/5

S/106/61/000/007/003/004

A055/A127

Calculation of transistorized amplifiers with feedback

subscripts "sh.circ." (short circuit) and "open" corresponding to the cases $Z_1 = 0$ and $Z_1 = \infty$ respectively. The analysis includes also the determination of the conditions for a stable operation of the amplifier. The replacement of the K-circuit (in Fig. 1) by its equivalent circuit gives the total equivalent circuit shown in Fig. 3. All the currents and voltages in this circuit coincide exactly with those of Fig. 1, provided that.

$$\dot{U}'_{k \text{ inp}} = \dot{U}'_{k \text{ inp}}, \quad (5)$$

where $\dot{U}'_{k \text{ inp}}$ determines the current $S_k \dot{U}'_{k \text{ inp}}$ generated by the current generator. Owing to the linearity of the system of Fig. 3, it is possible to examine independently the effects of the generators of the current $S_k \dot{U}'_{k \text{ inp}}$ and of the emf \dot{E} . The author examines first the case $E = 0$. In this case, voltage $\dot{U}'_{k \text{ inp}}$ produces voltage \dot{U}'_1 (at the amplifier output), current i' (at the amplifier input) and voltage U'_{coupl} (feedback voltage between points a and a'). An analysis of the circuit of Fig. 3 permits to obtain the following formulae:

$$\text{for the amplification factor of the K-circuit: } K = \frac{\dot{U}'_1}{\dot{U}'_{k \text{ inp}}}, \quad (6)$$

$$\text{for the insertion input admittance: } Y_{\text{insert}} = \frac{i'}{\dot{U}'_{k \text{ inp}}} \quad (7)$$

X

Card 2/5

28516 S/106/61/000/007/003/004

A055/A127

Calculation of transistorized amplifiers with feedback

and for the amplification factor along the feedback loop:

$$\bar{a} = \frac{U_{\text{coupl}}}{U_{k \text{ inp}}} \quad (8)$$

The author examines the case $U_{k \text{ inp}} = 0$. Here, the emf E produces voltage U_I (at the amplifier output), current I'' (at the amplifier input) and voltage U_{inp} (between points a and a'). An analysis of the circuit of Fig. 3, makes it possible to obtain the following formulae:

$$\text{for the voltage forward-path coefficient: } \Delta K = \frac{U_I}{E}, \quad (14)$$

for the coefficient of voltage transmission to the K-circuit input:

$$\bar{x} = \frac{U_{\text{inp}}}{E} \quad (15)$$

$$\text{and for the initial input conductance: } Y_{\text{inp o}} = \frac{I''}{E}. \quad (16)$$

The author derives the following final formulae for (1), (2) and (3):

$$K_c = \frac{\bar{x} \bar{K}}{1 - \bar{a}} + \Delta K, \quad (18)$$

✓

Card 3/5

*516

S/106/61/000/007/003/004

A055/A127

Calculation of transistorized amplifiers with feedback

$$Y_{inp\ c} = Y_{insert} \frac{\bar{X}}{1-\bar{a}} + Y_{inp\ o} \quad (19)$$

and

$$Y_{outp\ c} = \left(\frac{K_c}{Z_1} \right) sh.circ. \frac{1}{K_c \text{ open}}. \quad (20)$$

As for stability conditions (assuming that the circuit of Fig. 3 is stable), the characteristic equation of the system is:

$$\bar{a} = 1 \quad (21)$$

Since this equation coincides with the characteristic equation resulting from the accepted feedback theory, the considerations stated in this theory as to stability are valid for the general case analysed in this article. In the last part of the article, the author applies his analyses to two particular cases, and especially to the case of the emitter follower. He reproduces the formulae giving K , \bar{X} , \bar{a} , ΔK , Y_{insert} , $Y_{inp\ o}$ and, finally, K_c , such as these formulae are in these particular cases. There are 10 figures and 2 Soviet-bloc references.

TITLE: Numerical determination of the Fourier coefficients of a periodic function

PERIODICAL: Referativnyy zhurnal, Matematika, no.2, 1961, 25,
abstract 2V 176 ("Tr. Nauchno-tekhn. konferentsii Leningr.
elektrotekhn. in-ta svyazi", Vyp.2. L., 1960, 7-17)

TEXT: The author gives the derivation of approximate formulas being more exact than the Bessel ones for the calculation of the Fourier coefficients of a periodic (period T) function $f(t)$ which is given graphically or analytically. He obtains two variants of calculation formulas which distinguish by the kind in which $f(t)$ is approximated inside each of the $2N$ equal intervals into which the period is subdivided. Here $f(t)$ is replaced by a step curve or it is composed of $2N$ linear lines which, circumstances permitting, mutually are not combined. The second variant is recommended for practical calculations. The author gives an estimation of the absolute error arising for the determination of the Fourier coefficients according to the approximate formulas. A detailed description is given of the performance of the calculations

TITLE: Increase of vertical scale of a stereomodel by means of convergent aerophotosurvey

PERIODICAL: Referativnyy zhurnal, Astronomiya i Geodeziya, no. 7, 1962, 15, abstract 7G121 (In collection: "Ispol'zovaniye aerometodov pri issled. prirodn. resursov", Moscow-Leningrad, AN SSSR, 1961, 269 - 278)

TEXT: Contradictions in the present literature as to the evaluation of convergent aerophotosurvey are explained by the absence of a duly elaborated theory. Individual problems of the convergent aerophotosurvey theory are considered as applied to the case of determining elevations of two closely located points. Formulae are derived for elevations as a function of coordinates of points on aerial photographs and convergence angle, for errors in these elevations, and formulae for scales. The ratio of errors in elevations deduced from the plan and convergent aerosurveys, at the same flight altitude, characterizes the plan and convergent aerosurveys, at the same flight altitude, characterizes ✓

Card 1/2

Increase of vertical scale of...

S/035/62/000/007/C70/083
A001/A101

the value of the corresponding variant of convergent survey. This ratio increases with increasing focal length of the aerial camera; therefore, a possibility presents itself of attaining any prescribed accuracy in elevations from any flight altitude. The optimum variant of convergent aerosurvey is a survey with 100% lengthwise overlapping of the front photograph of the first pair and the rear photograph of the following pair at 45° inclination angle. There are 16 references.

TITLE: Polarizing light filters in marine aerial photography

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy. Geodeziya i
aerofotos"yemka, no. 6, 1960, 83-95

TEXT: The present paper deals with the theory and methods of reducing
the solar reflection in marine aerial photography with the aid of
polarizing light filters (polaroids). The recommendation to use the
latter for such purposes has been made in Refs. 17, 18. Experimental
marine aerial photographs with the use of polaroids were taken by the
Laboratory of Aerial Methods of the AS USSR in summer 1958. It was found
possible to extinguish the reflections in question. Still, polaroids
are no universal means for their elimination. The theory of reduction
of brightness of reflection with the aid of a polaroid is described first,
and the following formulas are derived:

Card 1/12

21323

S/154/60/000/006/004/005
S116/B201

Polarizing light filters in ...

$$s = T_r : 0.5 \quad k = 1 - q + 2q \cos^2 \xi \quad (3)$$

$$q = \left[\frac{\sin^2(\gamma - \varphi)}{\sin^2(\gamma + \varphi)} - \frac{\operatorname{tg}^2(\gamma - \varphi)}{\operatorname{tg}^2(\gamma + \varphi)} \right] : \left[\frac{\sin^2(\gamma - \varphi)}{\sin^2(\gamma + \varphi)} + \frac{\operatorname{tg}^2(\gamma - \varphi)}{\operatorname{tg}^2(\gamma + \varphi)} \right]. \quad (5)$$

$$\sin \psi = \sin \varphi : n = 0.75 \sin \varphi \quad (6), \quad \sin \beta' = \sin \beta : n' = \sin \beta : 1.521 \quad (7), \quad \cos 2\varphi = \sin h \cos \beta - \cos h \sin \beta \cos \psi \quad (8),$$

$$\sin \gamma = \cos h \frac{\sin \varphi}{\sin 2\varphi} \quad (9), \quad \cos \alpha = \cos \beta \cos \varphi + \sin \beta \sin \varphi \cos \gamma \quad (10),$$

$\operatorname{ctg} \xi = \cos \beta' \tan \psi \quad (11)$, $\cos \xi = -\cos \gamma \cos \xi + \sin \gamma \sin \xi \cos (\beta - \beta')$ (12). It is possible by these formulas to calculate the values of s and a for known h , β , and φ . T is the amount of light passing through a real polaroid. k is a coefficient dependent upon the quality of the polaroid, and is about equal to 0.7-0.8. q is the polarization degree of the light incident upon the polaroid. ξ is the angle between the direction of the light vector in the polarized ray hitting the polaroid and that in the ordinary ray (which penetrates the polaroid). h is the sun height,

Card 2/12

21323
S/154/60/000/006/004/006
P/16/B201

Polarizing light filters in ...

β is the angle of inclination of the projecting ray, α is the angle between the radius vector of the point concerned and the radius vector opposite to the sun's azimuth. γ is the angle of incidence of solar rays upon the water surface, and ϕ the corresponding angle of refraction. n is the refractive index of water. All other angles may be seen from Fig. 3a. Such calculations have been made by the authors for different β and α values for $h = 15, 25, 35$, and 45° . Results are presented in Fig. 4 in the form of isolines of magnitudes a^0 and $S\%$. The α -isolines are dashed, while the s -isolines are dash-dotted. Fig. 4 was obtained on the assumption that the axis of the polaroid is precisely perpendicular to the plane of the sun vertical. In the practice, this involves a certain error γ . It is found to be necessary for the polaroid to be adjusted with sufficient accuracy, as already at $\gamma = 5^\circ$ the coefficient s becomes very large (Fig. 5). The S -isolines (Fig. 4) refute the opinion holding that the polaroid is able to extinguish only a very narrow strip of the hotspot (in perpendicular to its axis). This widely accepted opinion is based upon the identification of the angle γ with the angle α . A knowledge of the S -isolines only is not sufficient to solve the problem as to how the reflection can be reduced, since the density of the

negative is not proportional to the brightness of the object. The reduction of the density of reflection in the point concerned is shown to depend not only on s but also on the brightness of reflection in this point. The brightness again depends on the form of the water surface, i.e., on the hydrometeorological conditions. Table 1 gives the absorption and reduction values of reflection, as obtained from the analysis of the above-mentioned experiment. It follows from Fig. 4 and Table 1 that only at $h \leq 45^\circ$ it is suitable to use the polaroids to reduce reflection and only at a focal length of the aerial camera of $f \leq 140$ mm (format of picture taken as 18×18 cm). A complete extinction of reflection can in practice be achieved only at $h \leq 25^\circ$, while in the other cases the reflection with respect to surface and density is considerably reduced. The utilization of polaroids is the more effective, the wider the angle of the objective of the aerial camera. Finally, the method applied in the test under discussion is described. The axis of the polaroid must be marked. The polaroid must then be attached to the aerial camera. The time of exposure must be increased by 1 : 0.5 k, viz., by the threefold. This increase is the chief disadvantage displayed

by polaroids. Prior to operation, the polaroid must be adjusted correctly, by turning the handle of its frame to the graduation equaling the angle λ between the direction toward the sun and the direction of the picture side. Experience has shown that it is by all means possible to adjust a polaroid with a maximum accuracy of 5° . The use of polaroids is not recommended in frequent changes of the flight azimuth with more than $10-15^\circ$. The experiment has also shown that the use of polaroids has no effect upon the sharpness and contrast of the pictures of sea-bottom contours or water surfaces. TITLE: Precise Determination of the Details in the Method of the Non-Distorted Model (Utochneniye detaley sposoba neiskazhennoy modeli).

PERIODICAL: Geodeziya i Kartografiya, 1957, Nr 12, pp. 28 - 40 (USSR).

ABSTRACT: The more accurate form obtained in the Laboratory for Aeromethods AN USSR for the method of the model is given here. The investigations referred to the case of a determination of the "banks" (increased height) of many points lying on a stereopair, on a stereocomparator without correcting device. The largest part of the conclusions obtained here also applies to other cases where this method of the non-distorted model is employed. The strict theoretical foundation of this method is only set forth in the doctor's dissertation by G. V. Romanovskiy "Analytical methods for the photogrammetric point-determination" which was hitherto not yet published. Some formulae from this dissertation are given here. Only formulae which are not to be found in any publication and whose derivation was carefully checked by the authors of the present paper are given. At first the linear interpolation of the γ -value is given. Then the orientation of the aerial photographs is investigated on the apparatus and it is shown

Card 1/3

Distorted Model. 6-12-1/14

that it is more expedient in the first approximation to replace the
standard formula :

$\Delta q = \frac{f^2}{l} (\Psi_a - \Psi_b)$ by a more accurate one with whose aid the Δq
may at once be obtained. This formula is derived here. Then the in-
fluence of the error of orientation is investigated. It is shown
that a comparison of the calculations of permissible errors of orien-
tation indicates that in the work according to the method recommen-
ded here the demands made on the accuracy of orientation may be re-
duced by the 3 to 6-fold amount. When the reduction-points are se-
lected in a manner that the parallax of each of them does not too
much differ from the parallax of the support lying next, and when
the method given here is employed for the construction of the Ψ -
diagrams and those of geodetical orientation, it is possible to
restrict oneself to only one orientation considerably more often
than it is otherwise customary. In the last chapter the determina-
tion of the parallactic coefficient is given. The derivation of the
necessary accuracy in determinations of H_0 and p is given, as well
as recommendations for attaining this accuracy. H_0 is the flight

Distorted Model. 6-12-4/1b

altitude above the starting point from which the increased heights
are begun to be read. $p -$ is the longitudinal parallax. The parallac-
tic coefficient $k = H_0 : p.$

There are 2 tables, and 2 Slavic references.

Tanning with Anthracene K. S. Ramm. Kirkpatrick
Oberauer Proc. S. S. S. R. 19, 102-4 (1931).—Anthracene
K contains: H₂O 35.5-30.5, tannides 36.1-34.6, non-
tanning substances 63.9-64.3, and ash 31.1-31.2%.
The hides after the application of the above substance and
after washing but before vegetable tanning contained
ash 3.2, fat 0.49, solubles 5.7, hide substance 63.7, com-
bined tannides 11.5%, tanning factor 18.1. The "Anthra-
cene K" alone did not produce satisfactory tanning
results and a final vegetable tanning had to be applied in
addition. The composition of the final leather obtained by
the above tanning as well as the procedure is described.

Synthetic tan from peat tans. S. Ramon and V. Peresadim. *Angewandte Chemie*, 19, 725 (1964). Acidic shale oil (c. below 20°) was sulfonated with 20% H_2SO_4 at about 45°, condensed with CH_3I and neutralized with $NaOH$. In tanning on lab. and semi-production scale the product had an effect similar to that of "anthracene K." Sulfonation of the phenol fraction from peat tar and condensation with 20% formalin yielded a synthetic tan which produced a leather far superior in quality to that tanned with "anthracene K." A similar tan was prep'd. from phenols condensed with sawdust in the presence of small amounts of HCl and sulfonated. A detailed description of the operations is given. A.A.U.

8-11-00

Synthesis of tars from post-tars. G. Razzola and V.
Panzica (Batt. Oltava, Praha, 1954, 12, 725-729).—

Arid shale oil ($\text{b.p.} < 300^\circ$) is epoxidized (65°), condensed with CH_3OH , and neutralized with NaOH . The product acts similarly to "asphaltene-II." Better tanning was obtained when the PhOH fraction of post tar was epoxidized and condensed with CH_3OH . A similar tan was obtained by condensation of PhOH and epoxide in presence of KCl and epoxidizing the product.
